

# Modeling Problems in Software

Envisioning the Domain as a Collection of Separate,  
Manageable Parts

# In This Module

- Breaking Up the Veterinary Office Domain
- The Importance of the Domain Experts
- A Play!
- Core elements of a Domain Model
- Sub-Domains and Bounded Contexts
- That Ubiquitous Term: Ubiquitous Language

**Do Not Place

Modeling a Subdomain

## A Play in One Act

# Appointment Scheduling

**Do Not Place  
Anything in This  
Space**

(Add watermark during  
editing)

Note: Warning will not

- Clients (people) schedule appointments for patients (pets)
- Appointments may be either office visits or surgeries
- Office visits may be an exam requiring a doctor, or a tech visit
- Office visits depend on exam room availability
- Surgeries depend on O/R and recovery space availability, and can involve different kinds of procedures
- Different appointment types and procedures require different staff

**Do Not Place  
Anything in This

# Key Takeaways From the Customer Conversation

- Patients and Clients are not the same thing to a Veterinarian
- The Customer gained better understanding of their own business process by describing it in terms we could understand and model
- We did our best to avoid speaking in programmer terms
- At this stage, the focus is on how the domain works, not how the software will work
  - We haven't even gotten to the point of collecting user stories or application requirements

**Do Not Place

Note: Warning will not

“

As software developers, we fail in  
two ways:  
We build the thing wrong, or  
We build the wrong thing.

”

— Steve Smith

# Translation

Paste Your Text Here (250 characters max)

As a veterinary technician  
I want to create an appointment for a patient  
So they know when to return for their office visit.

## Translation:

**Back to English:** Technical vétérinaire knows when to visit the patient close.

**To Bulgarian:** Технически Федералната знае кога да посетите пациента близо.

**Back to English:** Technical Federal knows when to visit the patient.

# Glossary of **Terms** from this Module

## Problem Domain

The specific problem the software you're working on is trying to solve.

## Core Domain

The key differentiator for the customer's business – something they must do well and cannot outsource.

## Sub-Domains

Separate applications or features your software must support or interact with.

## Bounded Context

A specific responsibility, with explicit boundaries that separate it from other parts of the system.

**Do Not Place  
Anything in This  
Space**

(Add watermark during

Note: Warning will not

# Glossary of **Terms** from this Module (cont.)

## Context Mapping

The process of identifying **bounded contexts** and their relationships to one another.

## Shared Kernel

Part of the model that is shared by two or more teams, who agree not to change it without collaboration

## Ubiquitous Language

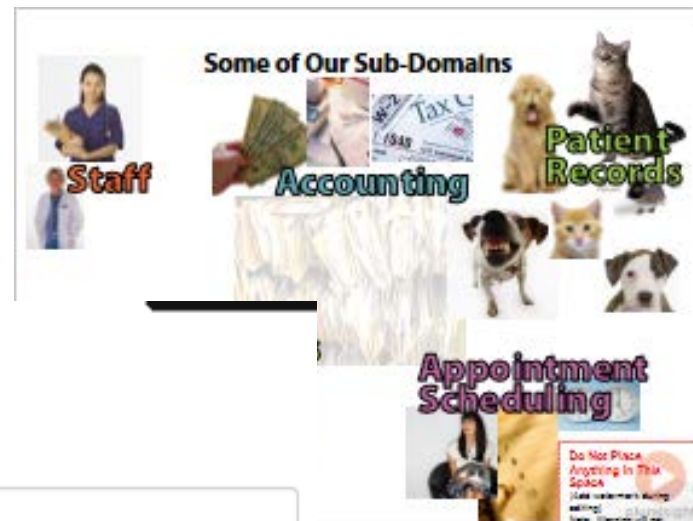

A language using terms from the domain model that programmers and domain experts use to discuss the system.
